

Why Traveling By Air Is Safe

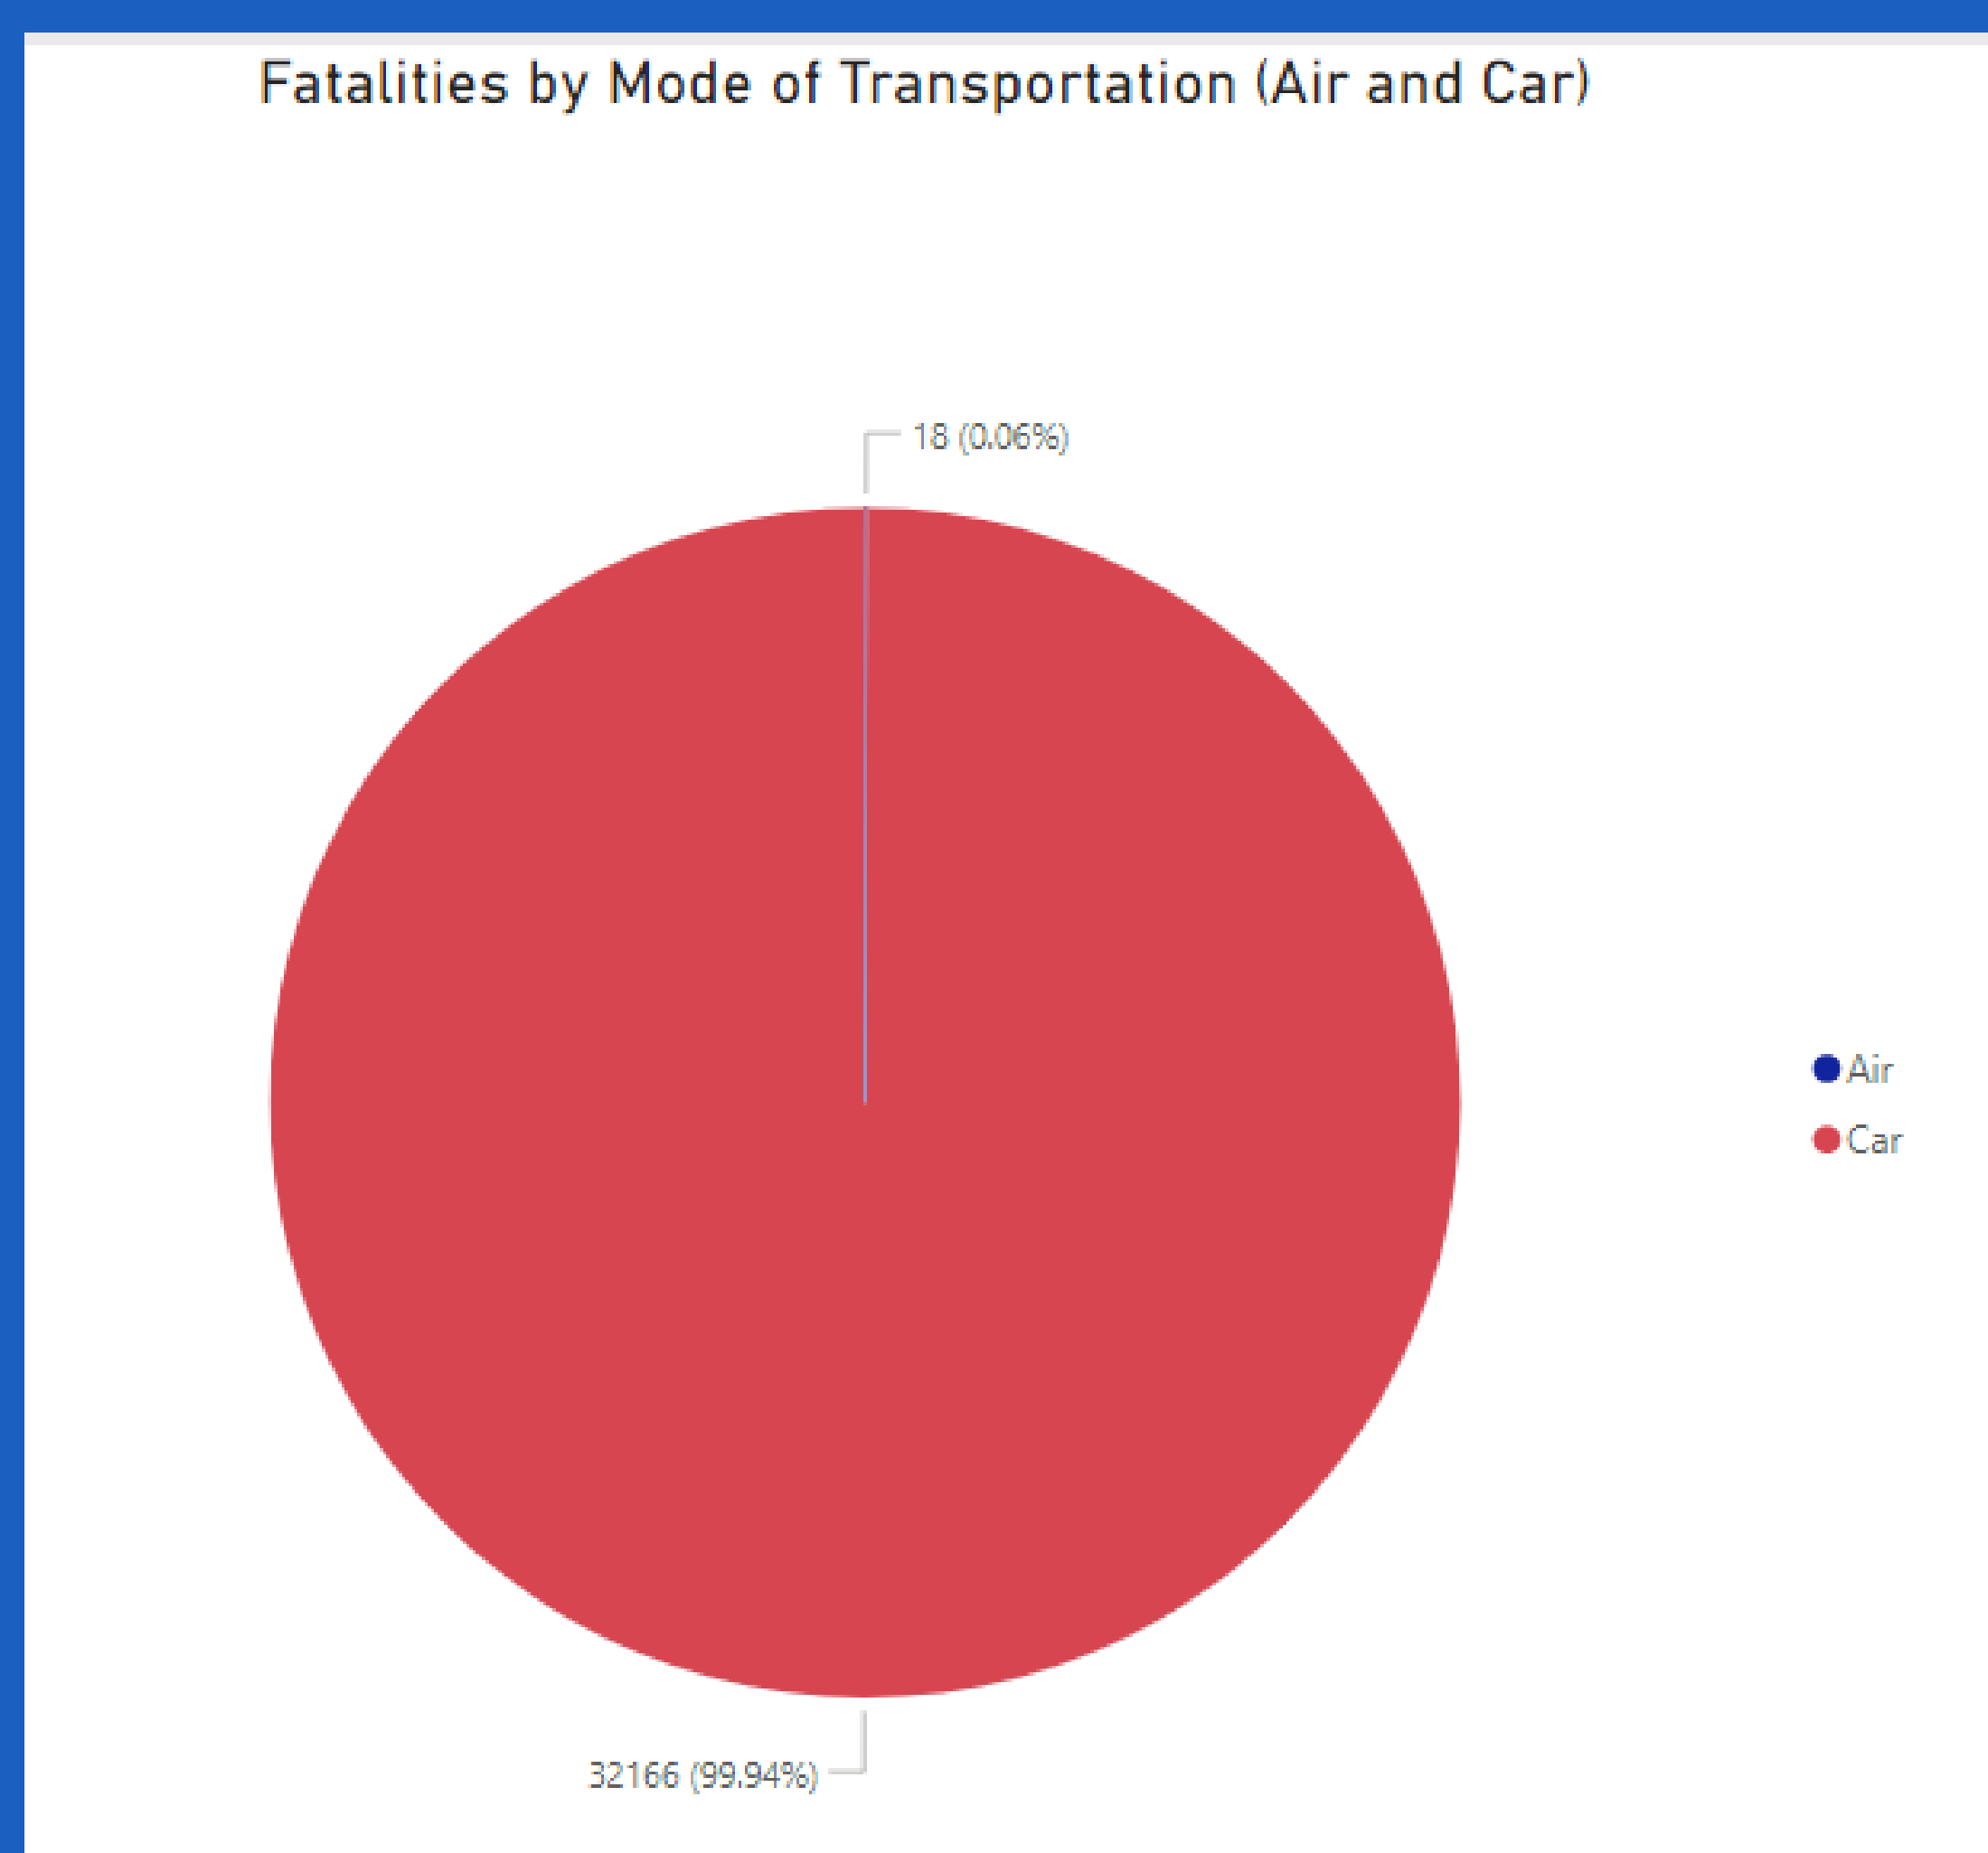

Erez Sarousi
Bellevue University

Despite the media attention and fears that you may have, flying in an airplane is the safest way to travel. Let's show you why.

Did You Know?

Between 1985 and 1999, there were just over 400 incidents aboard an airplane.

Is That A Lot?

Not compared to the most common mode of transportation there is - our very own car!

Some Airlines Had More Incidents Than Others

Aeroflot, Ethiopian Airlines and Delta Airlines ranked at the top for the most amount of incidents.

Chances Are Nothing Will EVER Happen To You Aboard A Flight

But even if there is an incident, the numbers show that it will lead to a fatal accident is VERY low.

Are We Safer Now?

Despite the increased amount of planes in the air, flight incidents are down by over 40%!

Safety Towards The Future!

Given the trends, statistics predict that 2015-2029 will yield only sixty incidents! This is less than 15% of 1985-1999's incident numbers!

You're safe on an airplane!

The facts are clear. You're safe flying on an airplane, so kick back and relax! There's nothing to worry about! However, with that being said, please remain seated with your seat belts fastened, just in case of unexpected turbulence. See you in Hawaii!
